

## Chapter-03

### Atoms and Molecules

Class-IX

Sub-Science

#### Page-32(IN-TEXTS QUES-ANS)

1. In a reaction, 5.3g of sodium carbonate reacted with 6 g of acetic acid. The products were 2.2 g of carbon dioxide, 0.9 g water and 8.2 g of sodium acetate. Show that these observations are in agreement with the law of conservation of mass.

Sodium carbonate + acetic acid →  
Sodium acetate + carbon dioxide +  
water

**Solution:**

Sodium carbonate + acetic acid →  
Sodium acetate + carbon dioxide +  
water

**5.3g 6g                      8.2g 2.2g 0.9g**

**As per the law of conservation of mass, the total mass of reactants must be equal to the total mass of products**

**As per the above reaction,**

**LHS = RHS**

**i.e.,  $5.3\text{g} + 6\text{g} = 2.2\text{g} + 0.9\text{g} + 8.2\text{g} = 11.3\text{g}$**

**Hence the observations are in agreement with the law of conservation of mass.**

**2. Hydrogen and oxygen combine in the ratio of 1:8 by mass to form water. What mass of oxygen gas would be required to react completely with 3 g of hydrogen gas?**

**Solution:**

**We know hydrogen and water mix in the ratio 1: 8.**

**For every 1g of hydrogen, it is 8g of oxygen.**

**Therefore, for 3g of hydrogen, the quantity of oxygen =  $3 \times 8 = 24\text{g}$**

**Hence, 24g of oxygen would be required for the complete reaction with 3g of hydrogen gas.**

**3. Which postulate of Dalton's atomic theory is the result of the law of conservation of mass?**

**Solution:**

**The postulate of Dalton's Atomic theory which is a result of the law of conservation of mass is,**

**“Atoms can neither be created nor destroyed”.**

**4. Which postulate of Dalton's atomic theory can explain the law of definite proportions?**

**Solution:**

**The postulate of Dalton's atomic theory that can explain the law of definite proportions is – the relative number and kinds of atoms are equal in given compounds.**

**Page-35(IN-TEXTS QUES-ANS)**

**1. Define the atomic mass unit?**

**Solution:**

**An atomic mass unit is a unit of mass used to express weights of atoms and molecules where one atomic mass is equal to  $1/12$ th the mass of one carbon-12 atom.**

**2. Why is it not possible to see an atom with naked eyes?**

**Solution:**

**It is not possible to see an atom with naked eyes because an atom is very, very small particle. The radius of an atom is of the order of  $10^{-10}$  metre.**

**Page-39(IN-TEXTS QUES-ANS)**

**1. Write down the formulae of**

**(i) sodium oxide**

**(ii) aluminium chloride**

**(iii) sodium sulphide**

**(iv) magnesium hydroxide**

**Solution:**

**The following are the formulae:**

**(i) sodium oxide –  $\text{Na}_2\text{O}$**

**(ii) aluminium chloride –  $\text{AlCl}_3$**

**(iii) sodium sulphide –  $\text{Na}_2\text{S}$**

**(iv) magnesium hydroxide –  $\text{Mg}(\text{OH})_2$**

**2. Write down the names of compounds represented by the following formulae:**

**(i)  $\text{Al}_2(\text{SO}_4)_3$**

**(ii)  $\text{CaCl}_2$**

**(iii)  $\text{K}_2\text{SO}_4$**

**(iv)  $\text{KNO}_3$**

**(v)  $\text{CaCO}_3$ .**

**Solution:**

**Listed below are the names of the compounds for each of the following formulae**

**(i)  $\text{Al}_2(\text{SO}_4)_3$  – Aluminium sulphate**

**(ii)  $\text{CaCl}_2$  – Calcium chloride**

**(iii)  $\text{K}_2\text{SO}_4$  – Potassium sulphate**

**(iv)  $\text{KNO}_3$  – Potassium nitrate**

**(v)  $\text{CaCO}_3$  – Calcium carbonate**

**3. What is meant by the term chemical formula?**

**Solution:**

**Chemical formula is the symbolic representation of its compositions.**

**For example: The chemical formula of hydrochloric acid is  $\text{HCl}$ .**

**4. How many atoms are present in a**

**(i)  $\text{H}_2\text{S}$  molecule and**

**(ii)  $\text{PO}_4^{3-}$  ion?**

**Solution:**

**The number of atoms present are as follows:**

(i)  $\text{H}_2\text{S}$  molecule has 2 atoms of hydrogen and 1 atom of sulphur hence 3 atoms in totality.

(ii)  $\text{PO}_4^{3-}$  ion has 1 atom of phosphorus and 4 atoms of oxygen hence 5 atoms in totality.

### Page-40 (IN-TEXTS QUES-ANS)

1. Calculate the molecular masses of  $\text{H}_2$ ,  $\text{O}_2$ ,  $\text{Cl}_2$ ,  $\text{CO}_2$ ,  $\text{CH}_4$ ,  $\text{C}_2\text{H}_6$ ,  $\text{C}_2\text{H}_4$ ,  $\text{NH}_3$ ,  $\text{CH}_3\text{OH}$ .

**Solution:**

The following are the molecular masses:

The molecular mass of  $\text{H}_2$  – 2 x atoms  
atomic mass of H =  $2 \times 1\text{u} = 2\text{u}$

The molecular mass of  $\text{O}_2$  – 2 x atoms  
atomic mass of O =  $2 \times 16\text{u} = 32\text{u}$

The molecular mass of  $\text{Cl}_2$  – 2 x atoms  
atomic mass of Cl =  $2 \times 35.5\text{u} = 71\text{u}$

The molecular mass of  $\text{CO}_2$  – atomic  
mass of C + 2 x atomic mass of O =  $12$   
+  $(2 \times 16)\text{u} = 44\text{u}$

The molecular mass of  $\text{CH}_4$  – atomic  
mass of C + 4 x atomic mass of H =  $12$   
+  $(4 \times 1)\text{u} = 16\text{u}$

The molecular mass of  $\text{C}_2\text{H}_6$  – 2 x  
atomic mass of C + 6 x atomic mass of  
H =  $(2 \times 12) +$   
 $(6 \times 1)\text{u} = 24 + 6 = 30\text{u}$

The molecular mass of  $\text{C}_2\text{H}_4$  – 2 x  
atomic mass of C + 4 x atomic mass of  
H =  $(2 \times 12) +$   
 $(4 \times 1)\text{u} = 24 + 4 = 28\text{u}$

The molecular mass of  $\text{NH}_3$  – atomic mass of N + 3 x atomic mass of H =  $(14 + 3 \times 1)\text{u} = 17\text{u}$

The molecular mass of  $\text{CH}_3\text{OH}$  – atomic mass of C + 3x atomic mass of H + atomic mass of O + atomic mass of H =  $(12 + 3 \times 1 + 16 + 1)\text{u} = (12 + 3 + 17)\text{u} = 32\text{u}$

2. Calculate the formula unit masses of  $\text{ZnO}$ ,  $\text{Na}_2\text{O}$ ,  $\text{K}_2\text{CO}_3$ , given atomic masses of Zn = 65u,

Na = 23 u, K=39u, C = 12u, and O=16u.

**Solution:**

**Given:**

Atomic mass of Zn = 65u

Atomic mass of Na = 23u

Atomic mass of K = 39u

Atomic mass of C = 12u

**Atomic mass of O = 16u**

**The formula unit mass of ZnO = Atomic mass of Zn + Atomic mass of O =  
65u+16u = 81u**

**The formula unit mass of Na<sub>2</sub>O = 2 x Atomic mass of Na + Atomic mass of O  
= (2 x 23)u +16u=46u+16u=62u**

### **Page-42 (IN-TEXTS QUES-ANS)**

**1. If one mole of carbon atoms weighs 12grams, what is the mass (in grams) of 1 atom of carbon?**

**Solution:**

**Given: 1 mole of carbon weighs 12g**

**1 mole of carbon atoms =  $6.022 \times 10^{23}$**

**Molecular mass of carbon atoms = 12g  
= an atom of carbon mass**

Hence, mass of 1 carbon atom =  $12 / 6.022 \times 10^{23} = 1.99 \times 10^{-23} \text{g}$

2. Which has more number of atoms, 100 grams of sodium or 100 grams of iron (given, atomic mass of Na = 23u, Fe = 56 u)?

**Solution:**

**Given: Atomic mass of Na=23u,**

**Atomic mass of Fe= 56u**

**To calculate the number of atoms in 100g of sodium:**

**23g of Na contains =  $6.022 \times 10^{23}$  atoms**

**1g of Na contains =  $6.022 \times 10^{23}$  atoms / 23**

**100g of Na contains =  $6.022 \times 10^{23}$  atoms X 100 / 23**

**=  $2.6182 \times 10^{24}$  atoms**

To calculate the number of atoms in 100g of sodium:

56g of Fe contains =  $6.022 \times 10^{23}$  atoms

1g of Fe contains =  $6.022 \times 10^{23}$  atoms / 56

100g of Fe contains =  $6.022 \times 10^{23}$  atoms  $\times 100 / 56$   
=  $1.075 \times 10^{24}$  atoms

Hence, through comparison, it is evident that 100g of Na has more atoms.

**(Exercise Questions )Page: 43**

1. A 0.24g sample of compound of oxygen and boron was found by analysis to contain 0.096g of boron and 0.144g of oxygen. Calculate the

**percentage composition of the compound by weight.**

**Solution:**

**Given: Mass of the sample compound = 0.24g, mass of boron = 0.096g, mass of oxygen = 0.144g**

**To calculate percentage composition of the compound:**

**Percentage of boron = mass of boron / mass of the compound x 100**

**= 0.096g / 0.24g x 100 = 40%**

**Percentage of oxygen = 100 – percentage of boron**

**= 100 – 40 = 60%**

**2. When 3.0g of carbon is burnt in 8.00 g of oxygen, 11.00 g of carbon dioxide is produced. What mass of carbon dioxide will be formed when 3.00g of**

**carbon is burnt in 50.00 g of oxygen?  
Which law of chemical combination  
will govern your answer?**

**Solution:**

**11.00g of carbon dioxide is formed  
when 3.00g carbon is burnt in 8.00g of  
oxygen.**

**Carbon and oxygen are combined in  
the ratio 3:8 to give carbon dioxide  
using up all the carbon and  
oxygen**

**Hence, for 3g of carbon and 50g of  
oxygen, 8g of oxygen is used and 11g  
of carbon is formed, the**

**left oxygen is unused i.e.,  $50-3=47$ g of  
oxygen is unused.**

**This depicts the law of definite proportions – The combining elements in compounds are present in definite proportions by mass.**

**3. What are polyatomic ions? Give examples.**

**Solution:**

**Polyatomic ions are ions that contain more than one atom but they behave as a single unit**

**Example:  $\text{CO}_3^{2-}$  ,  $\text{H}_2\text{PO}_4^-$**

**4. Write the chemical formula of the following.**

**(a) Magnesium chloride**

**(b) Calcium oxide**

**(c) Copper nitrate**

**(d) Aluminium chloride**

**(e) Calcium carbonate**

**Solution:**

**The following are the chemical formula of the above-mentioned list:**

**(a) Magnesium chloride –  $\text{MgCl}_2$**

**(b) Calcium oxide –  $\text{CaO}$**

**(c) Copper nitrate –  $\text{Cu}(\text{NO}_3)_2$**

**(d) Aluminium chloride –  $\text{AlCl}_3$**

**(e) Calcium carbonate –  $\text{CaCO}_3$**

**5. Give the names of the elements present in the following compounds.**

**(a) Quick lime**

**(b) Hydrogen bromide**

**(c) Baking powder**

**(d) Potassium sulphate.**

**Solution:**

**The following are the names of the elements present in the following compounds:**

**(a) Quick lime – Calcium and oxygen (CaO)**

**(b) Hydrogen bromide – Hydrogen and bromine (HBr)**

**(c) Baking powder – Sodium, Carbon, Hydrogen, Oxygen (NaHCO<sub>3</sub>)**

**(d) Potassium sulphate – Sulphur, Oxygen, Potassium (K<sub>2</sub>SO<sub>4</sub>)**

**6. Calculate the molar mass of the following substances.**

**(a) Ethyne, C<sub>2</sub>H<sub>2</sub>**

**(b) Sulphur molecule, S<sub>8</sub>**

**(c) Phosphorus molecule, P<sub>4</sub> (Atomic mass of phosphorus =31)**

**(d) Hydrochloric acid, HCl**

**(e) Nitric acid,  $\text{HNO}_3$**

**Solution:**

**Listed below is the molar mass of the following substances:**

**(a) Molar mass of Ethyne  $\text{C}_2\text{H}_2 = 2 \times$   
Mass of C +  $2 \times$  Mass of H =  
 $(2 \times 12) + (2 \times 1) = 24 + 2 = 26\text{g}$**

**(b) Molar mass of Sulphur molecule  
 $\text{S}_8 = 8 \times$  Mass of S =  $8 \times 32 = 256\text{g}$**

**(c) Molar mass of Phosphorus  
molecule,  $\text{P}_4 = 4 \times$  Mass of P =  $4 \times 31 =$   
 $124\text{g}$**

**(d) Molar mass of Hydrochloric acid,  
 $\text{HCl} =$  Mass of H + Mass of Cl =  $1 + 35.5 =$   
 $36.5\text{g}$**

**(e) Molar mass of Nitric acid,  
 $\text{HNO}_3 =$  Mass of H + Mass of Nitrogen +  
 $3 \times$  Mass of O =  $1 + 14 +$**

$$3 \times 16 = 63\text{g}$$

7. What is the mass of –

(a) 1 mole of nitrogen atoms?

(b) 4 moles of aluminium atoms (Atomic mass of aluminium = 27)?

(c) 10 moles of sodium sulphite ( $\text{Na}_2\text{SO}_3$ )?

**Solution:**

The mass of the above mentioned list is as follows:

(a) Atomic mass of nitrogen atoms = 14u

Mass of 1 mole of nitrogen atoms =  
Atomic mass of nitrogen atoms

Therefore, mass of 1 mole of nitrogen atom is 14g

**(b) Atomic mass of aluminium = 27u**

**Mass of 1 mole of aluminium atoms = 27g**

**1 mole of aluminium atoms = 27g, 4**

**moles of aluminium atoms =  $4 \times 27 = 108\text{g}$**

**(c) Mass of 1 mole of sodium sulphite**

**$\text{Na}_2\text{SO}_3$  = Molecular mass of sodium**

**sulphite =  $2 \times \text{Mass of Na} + \text{Mass of S} +$**

**$3 \times \text{Mass of O} = (2 \times 23) + 32 + (3 \times 16) =$**

**$46 + 32 + 48 = 126\text{g}$**

**Therefore, mass of 10 moles of  $\text{Na}_2\text{SO}_3$**

**=  $10 \times 126 = 1260\text{g}$**

**8. Convert into mole.**

**(a) 12g of oxygen gas**

**(b) 20g of water**

**(c) 22g of carbon dioxide**

**Solution:**

**Conversion of the above-mentioned molecules into moles is as follows:**

**(a) Given: Mass of oxygen gas=12g**

**Molar mass of oxygen gas = 2 Mass of Oxygen =  $2 \times 16 = 32\text{g}$**

**Number of moles = Mass given / molar mass of oxygen gas =  $12/32 = 0.375$  moles**

**(b) Given: Mass of water = 20g**

**Molar mass of water = 2 x Mass of Hydrogen + Mass of Oxygen =  $2 \times 1 + 16 = 18\text{g}$**

**Number of moles = Mass given / molar mass of water  
=  $20/18 = 1.11$  moles**

**(c) Given: Mass of carbon dioxide = 22g**

**Molar mass of carbon dioxide = Mass of C + 2 x Mass of Oxygen = 12 + 2x 16 = 12+32=44g**

**Number of moles = Mass given/ molar mass of carbon dioxide = 22/44 = 0.5 moles**

**9. What is the mass of:**

**(a) 0.2 mole of oxygen atoms?**

**(b) 0.5 mole of water molecules?**

**Solution:**

**The mass is as follows:**

**(a) Mass of 1 mole of oxygen atoms = 16u, hence it weighs 16g**

**Mass of 0.2 moles of oxygen atoms = 0.2 x 16 = 3.2u**

**(b) Mass of 1 mole of water molecules = 18u, hence it weighs 18g**

**Mass of 0.5 moles of water molecules  
=  $0.5 \times 18 = 9\text{u}$**

**10. Calculate the number of molecules of sulphur ( $\text{S}_8$ ) present in 16g of solid sulphur.**

**Solution:**

**To calculate molecular mass of sulphur:**

**Molecular mass of Sulphur ( $\text{S}_8$ ) =  
 $8 \times \text{Mass of Sulphur} = 8 \times 32 = 256\text{g}$**

**Mass given = 16g**

**Number of moles = mass given/ molar mass of sulphur**

**=  $16/256 = 0.0625$  moles**

**To calculate the number of molecules of sulphur in 16g of solid sulphur:**

**Number of molecules = Number of moles x Avogadro number**

$$= 0.0625 \times 6.022 \times 10^{23} \text{ molecules}$$

$$= 3.763 \times 10^{22} \text{ molecules}$$

**11. Calculate the number of aluminium ions present in 0.051g of aluminium oxide.**

**(Hint: The mass of an ion is the same as that of an atom of the same element. Atomic mass of Al = 27u)**

**Solution:**

**To calculate the number of aluminium ions in 0.051g of aluminium oxide:**

**1 mole of aluminium oxide =  $6.022 \times 10^{23}$  molecules of aluminium oxide**

**1 mole of aluminium oxide ( $\text{Al}_2\text{O}_3$ ) = 2 x Mass of aluminium + 3 x Mass of Oxygen**

$$= (2 \times 27) + (3 \times 16) = 54 + 48 = 102\text{g}$$

**1 mole of aluminium oxide = 102g =  
6.022 x 10<sup>23</sup> molecules of aluminium  
oxide**

**Therefore, 0.051g of aluminium oxide  
has = 0.051 x 6.022 x 10<sup>23</sup> / 102  
= 3.011 x 10<sup>20</sup> molecules of  
aluminium oxide**

**One molecule of aluminium oxide has  
2 aluminium ions, hence number of  
aluminium ions present in 0.051g of  
aluminium oxide = 2 x 3.011x  
10<sup>20</sup> molecules of aluminium oxide  
= 6.022 x 10<sup>20</sup>**
